* Due to the special texture of these collections, for installation, we recommend using the smallest possible amount of grout material, avoiding over grouting the piece, just the joint. The grout must be cleaned off the surface of the tile before it has dried, with a non-abrasive sponge, mild soap and water.

TILE-LAYING RECOMMENDATIONS

The correct installation and commissioning of a system of ceramic cladding is a process that involves all the professionals and processes involved in the project. In all cases it is necessary to read the manufacturers' recommendations, as well as the technical specifications of all the products and materials used.

These recommendations are based on the UNE 138002 Standard and are valid exclusively within the scope of application set forth therein. In any other case, refer to the prevailing regulations of each country.

PLACEMENT JOINTS

This refers to the physical separation between adjoining tiles which serves technical/aesthetic functions in the ceramic system and is essential to its final quality and durability.

Under no circumstances should ceramic cladding or flooring be installed without joints.

A minimal joint measuring between 1,5 mm and 3 mm wide should be used in interior cladding and flooring, on stable backing surfaces and in flooring without radiant heating or other mechanical demands.

GENERAL REQUIREMENTS FOR FITTING USING ADHESIVES

- The layer of fixing material must be applied on the flat surface in a regular manner with a uniform thickness and flatness.

- The appropriate trowel must be selected according to the type of installation, the tile dimensions and the type of adhesive being used. In general, we will use trowels with teeth measuring between 8 and 10 mm.

- For unstable backing surfaces and large tile formats, we will select S1 or S2-type deformable adhesives.

- The adhesive must be protected from drying too quickly and from the presence of humidity.

- Tiles with a low water absorption capacity should not be allowed to get wet.

- The application must be carried out when the room temperature and that of the backing surface and the materials is between +5°C and +30°C, without strong winds or rain in the case of outdoor fittings.

FITTING THE TILES

- Please check the size, caliber, tone, colour, quality of the pieces before the installation and if there is enough product to finish the work. No claims will be accepted once material has been installed.

- As general rule, tiles must be installed in the same position. This position is indicated with a sign in the back side of each tile (arrow or similar).

- Tiles should be placed with straight and regular joints between them.

- For large formats fitting against obstacles should be performed at a distance of 20% of the size of the piece or less and with an open joint of at least 3 mm.

- Within the adjustment time, it is recommended to lift one of the tiles to check if the required contact area is being achieved.

- The excess adhesive must be removed from the joints before it hardens to produce proper grouting.

- Protect the recently-installed ceramics from severe weather, frost and premature drying, as well as from any possible damages that subsequent works may cause.

* We do not recommend its use in rectified white body wall tiles. They can be chipped when the wedges are removed, as these products do not have the strength of the porcelain tiles at the edges.

GROUTING

This must be carried out with materials developed specifically for this purpose, defined and classified in standard UNE EN 13888.

- Grouting should be carried out at least 24 hours after fitting. The pointing material should be applied in accordance with the manufacturer's

- In general, we will use a CG2-type pointing material.

- For cases in which a high mechanical resistance, sealing and chemical resistance are required, we will use RG1-type pointing material.

- The grout is to be spread using a suitable rubber trowel, filling the entire depth of the joints with diagonal movements.

FINAL CLEANING

To give the ceramic cladding a proper finish, a proper final clean must be carried out. This way, any remnants of cement, joint-sealing materials and other residue will be removed. To do this, we recommended the following steps:

- Clean the installed ceramic cladding well, removing dirt and remnants of material, dust, etc.

- Apply water to the surface, wipe it and leave to dry.

- Apply the descaling agent (such as diluted DETERDEK by FILA, according to the manufacturer's indications), leave it to work for a few minutes and wash the surface well.

- Finish the cleaning process by rinsing with abundant clean water.

If, after carrying out the process and once the material has dried, there are still remnants of adhesive, the process can be repeated again to remove it. Care must be taken when applying the descaling agent to prevent it from being left on the joint, since if it is applied to the joint it can attack it and alter it.
